

Data Binding & Validation

Data Binding

```
@RequestMapping(method = RequestMethod.POST)
public String save(Country country, BindingResult result) {
    if(result.hasErrors())
        return "countryForm";
    service.addCountry(country);
    return "redirect:/country.htm";
}
```

Data Binding

- Spring will
 - create object
 - call setter for each parameter
 - pass the object to the method

created from
request parameters

```
@RequestMapping(method = RequestMethod.POST)
public String save(Country country, BindingResult result) {
    if(result.hasErrors())
        return "countryForm";
    service.addCountry(country);
    return "redirect:/country.htm";
}
```

JavaBean

```
public class Country {  
    private String name;
```

```
    public Country() {  
    }
```

public no-arg constructor

```
    public String getName() {  
        return name;  
    }
```

getter and setter
define a property

```
    public void setName(String name) {  
        this.name = name;  
    }
```

```
}
```

Binding your form

```
<form:form method="POST" action="{pageContext.request.contextPath}/country.htm"
                                modelAttribute="country">
    <form:hidden path="id" />

    <p class="form-group">
        <label for="name" class="control-label">Name (required):</label>
        <form:input id="name" path="name"/>
        <form:errors path="name" cssClass="error"/>
    </p>

    <p class="form-group">
        <label for="numberInhabitants" class="control-label">
            Number of inhabitants:</label>
        <form:input id="numberInhabitants" path="numberInhabitants"/>
        <form:errors path="numberInhabitants" cssClass="error"/>
    </p>

    <p>
        <input id="save" type="submit" class="btn btn-default">Save</input>
    </p>
</form:form>
```

BindingResult

- BindingResult will
 - hold the result of the validation, binding and contain errors that may have occurred
 - must be defined right after the model object

```
@RequestMapping(method = RequestMethod.POST)
public String save(Country country, BindingResult result) {

}
```

Can be used to retrieve error messages

Handling Errors

```
@RequestMapping(method = RequestMethod.POST)
public String save(Country country, BindingResult result) {
    if(result.hasErrors())
        return "countryForm";
    service.addCountry(country);
    return "redirect:/country.htm";
}
```

WHAT ABOUT PROPER ERROR MESSAGES?

New Country

Name (required):

Property name threw exception; nested exception is
org.ucll.demo.domain.DomainException: Name should not be empty.

Number of inhabitants:

Failed to convert property value of type java.lang.String to required type int for
property numberInhabitants; nested exception is java.lang.NumberFormatException:
For input string: ""
